ASSIGNMENT-2:

Task - 2 : Write a function decrementGlobal() that uses and modifies a global variable count.

- Define a global variable count and take the input.
- Define the function decrementGlobal().
- Inside the function, decrement count by 2 and return the new value.
- Print the result of decrementGlobal() and count.

Sample input:

10

Sample output:

8

8

Explanation:

- The user inputs 10 as the initial value of count.
- The decrementGlobal() function is called, which decrements count by 2, resulting in 8.
- The function returns 8, which is printed.
- The global variable count is now 8, and printing count confirms this update.
